

## About the food processing software GOSystems

Production and distribution companies in the food industry have unique and comprehensive management needs that cannot be solved in a standard ERP solution or through a traditional automation solution.

Frontmateg has developed the MES system GOSystems, which meets those needs. GOSystems is an integrated and flexible system that controls the slaughter process from the reception of live animals to classification. It allows processors to control and monitor key points in the slaughter process in real time while ensuring traceability and execution of quality control procedures.

## Label and track your hide with GO.De-hiding

Labelling and tracking of the hide is a crucial part of the process. The GOSystems de-hiding terminal offers a well-defined and flexible platform to be in the complete control of the de-hiding process.

Added transparency captures high-level information regarding a supply chain which can be put to profitable use in beef production planning as well as valuable feedback to farmers.

### Prerequisite

- The RFID reader must be operational.
- The hooks RFID must be operational.
- The printer(s) must be operational

### Benefits

- Control, registration & labelling of all hides through the entire process
- Data available for further planning & steps in the process

### Related services

- Traceability
- Reporting
